THE CREATIVE TRADER

Confirmation Model Checklist

WHAT IS THE CONFIRMATION MODEL?

Every trader wants clarity: that moment when the chart finally makes sense and you know exactly what to do. The ***Confirmation Model*** was built for that moment.

It's a simple four-step system designed to spot high-probability setups. Instead of guessing where price *might* go, you're reading what it's actually telling you. Each step confirms the last. Each confirmation adds proof until you have everything you need to confidently enter a trade.

Most traders don't wait for that. They jump in early, trading off one or two signals, hoping the rest falls into place. The Confirmation Model forces patience. It slows things down just enough for you to see the whole picture before risking capital, because profits comes from confirmation, not hope.

In this checklist, you'll learn:

- The four confirmations that *must* align before taking a trade
- How to use each one in the right order
- When not to trade, and why that's often your best decision
- Real chart examples showing the model in action

By the end, you'll see the market differently: not as noise to decode, but as a structure you can read.

This is the same system I use every morning during the New York open. One or two setups, 90 minutes, done.

CONFIRMATION #1: LIQUIDITY SWEEP

Every setup begins with intent, and in trading, intent shows up through liquidity.

A liquidity sweep happens when price runs above a swing high or below a swing low, triggering stop orders before reversing direction. Those stops (the automatic exit points of traders already in the market) act as pools of liquidity. When price hits them, it gives the market the fuel it needs to move the other way.

This is your first confirmation: proof that the market has collected what it needs before shifting direction. **No sweep, no setup.**

✅ Action Items

- Before market opens, find your swing highs and swing lows
- Label Buy-side liquidity: stops resting above swing highs
- Label Sell-side liquidity: stops resting below swing lows
- Watch for price to push just beyond one of those levels

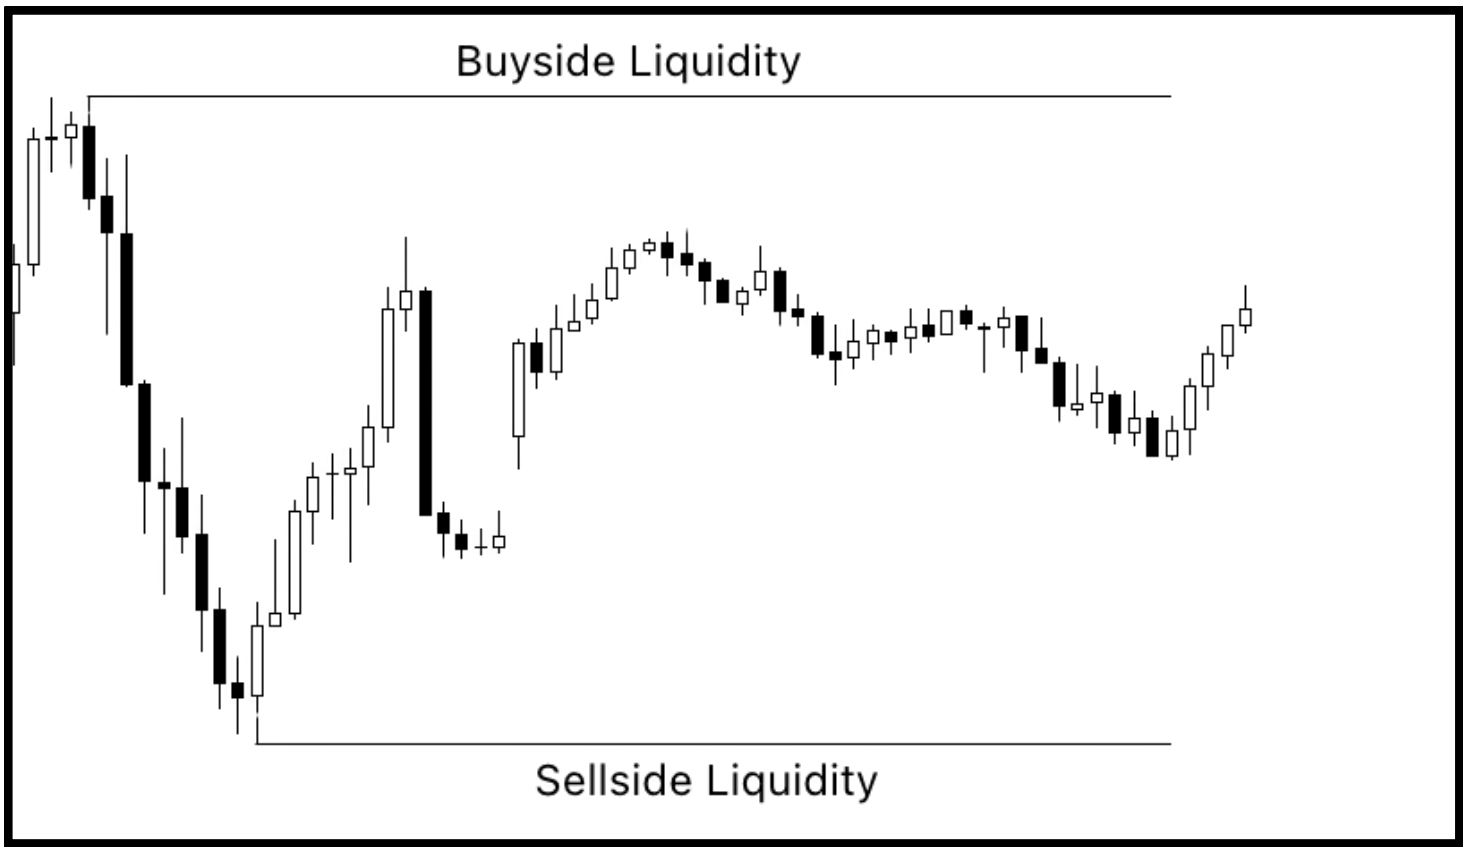

That's your liquidity sweep: the first piece of proof that the market has confirmed intent.

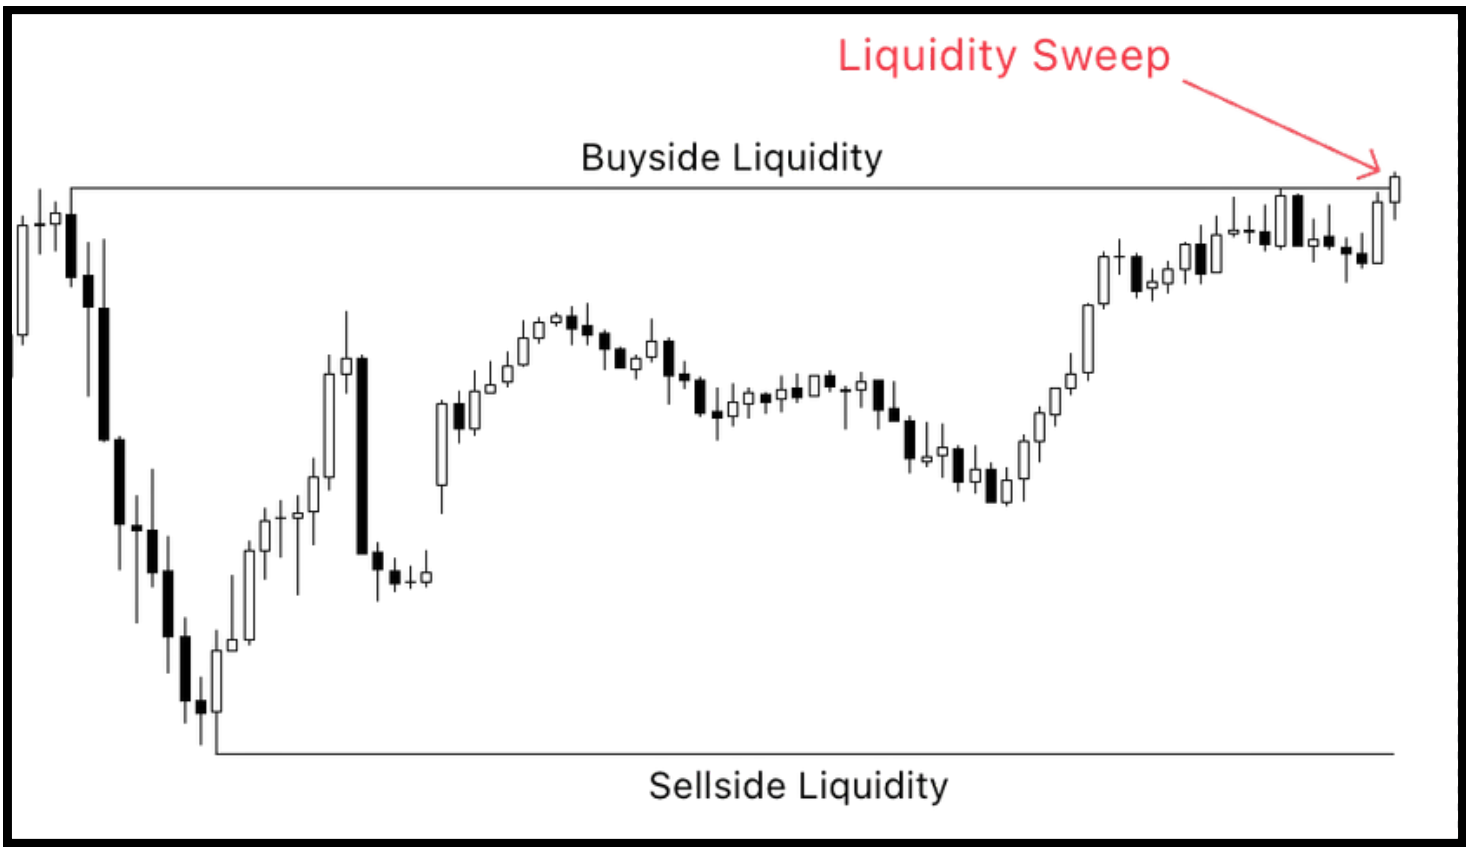

With that in place, you're ready to look for Confirmation #2.

❌ Common Mistake

Don't try to predict the sweep. Let the market come to you. The sweep is a confirmation, not a guess.

CONFIRMATION #1: LIQUIDITY SWEEP

CONFIRMATION #2: HIGER TIMEFRAME FVG

A Higher TimeFrame (HTF) Fair Value Gap (FVG) is an inefficiency created when price moves so fast on a higher timeframe (1-hour or 15-minute chart), it leaves a gap behind.

When price returns to that gap and rejects, that's delivery. This is your institutional anchor: proof that smart money is defending a level.

✅ Action items

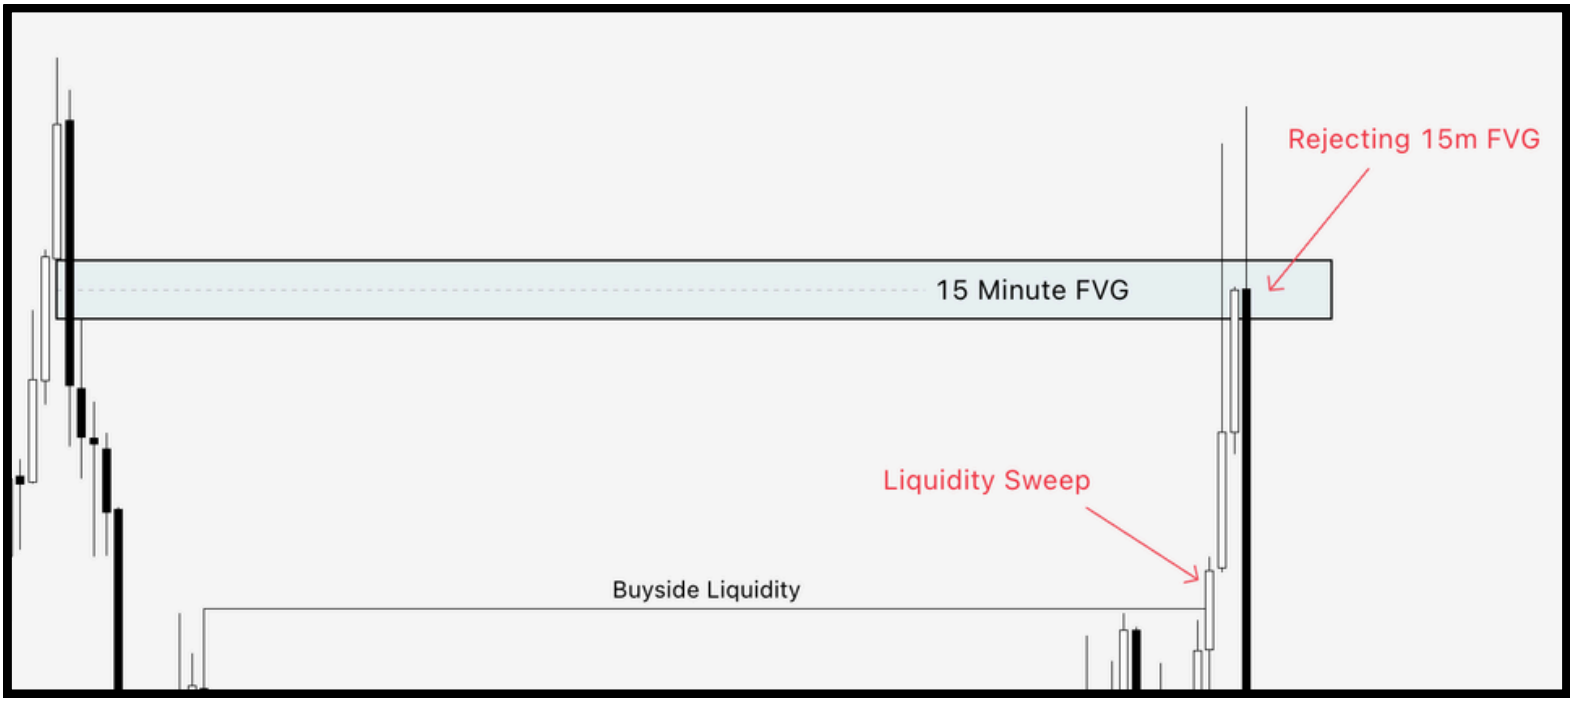

- Use 1-hour or 15-minute charts only (no lower timeframes!)
- Identify a 3-candle gap where the middle candle has no wick overlapping with the first and third (this is your FVG)
- Price must tap into the gap and reject back in the direction it came from
- If price closes through the gap, it's invalidated

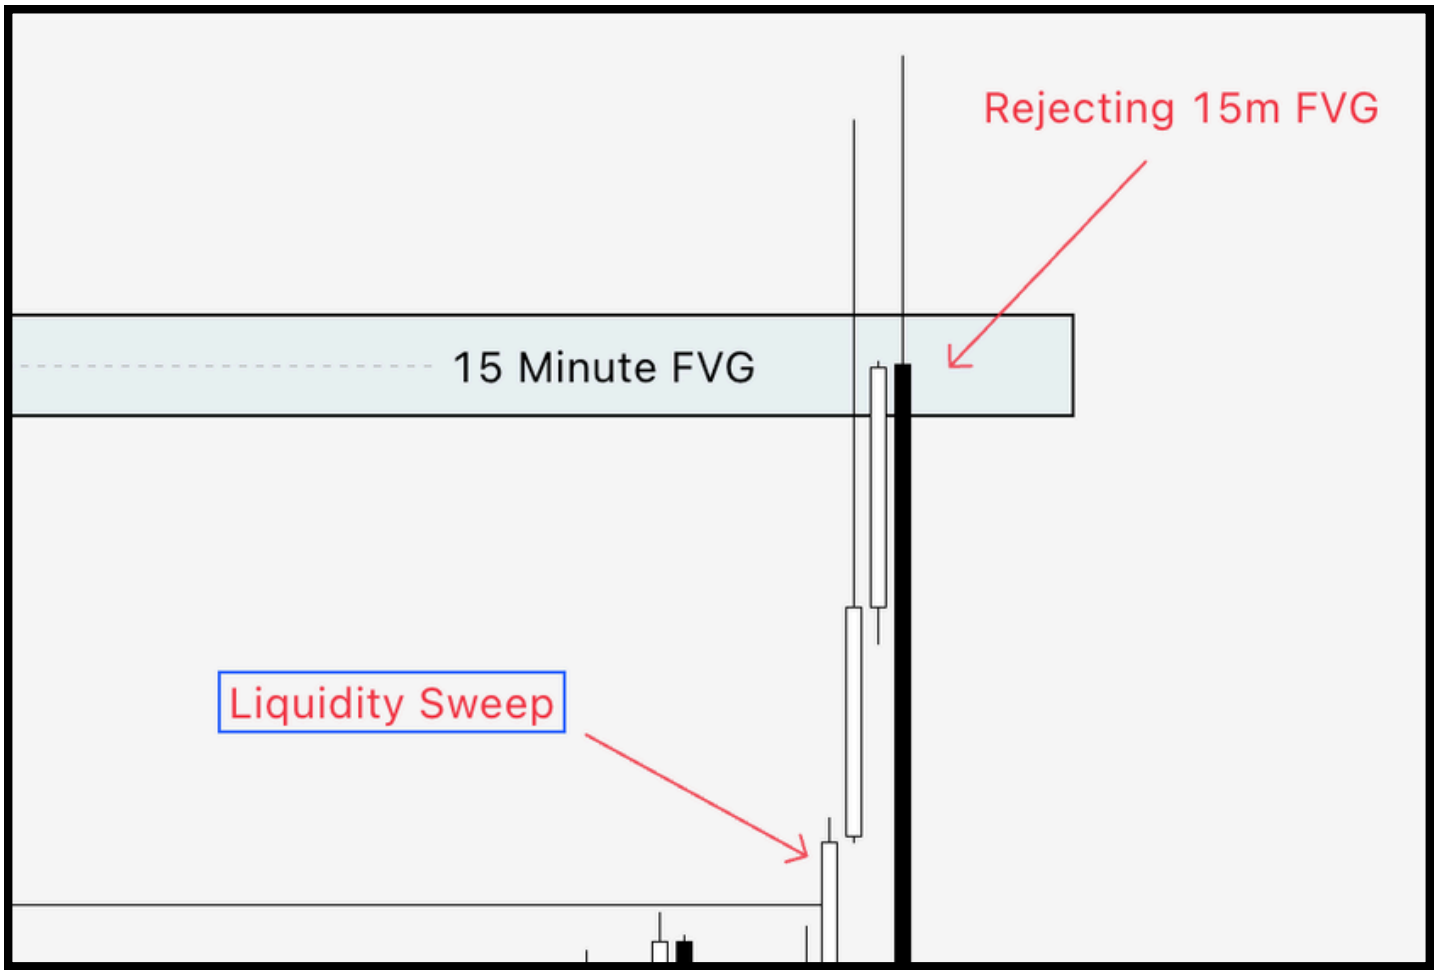

That rejection confirms institutional support. With Confirmation #1 (the sweep) and Confirmation #2 (HTF FVG delivery) aligned, you're ready for Confirmation #3.

❌ Common Mistake

Don't look for delivery from lower timeframes, such as FVGs that appear on the 1 through 5 minute timeframe. They aren't strong enough to verify the confirmation.

CONFIRMATION #2: HIGER TIME FRAME FVG

CONFIRMATION #3: FVG INVERSION

An **FVG inversion** happens when price creates a Fair Value Gap, then immediately disrespects it by closing through the opposite side.

Unlike the HTF FVG (where we want respect), here we want dissrespect. When price runs through the gap, it signals order flow has shifted and momentum has flipped.

✅ Action items

- Drop to a lower timeframe: 1, 2, 3, 4, or 5-minute chart
- Wait for an FVG to form (3-candle pattern)
- Watch for price to close through the FVG, not just wick through

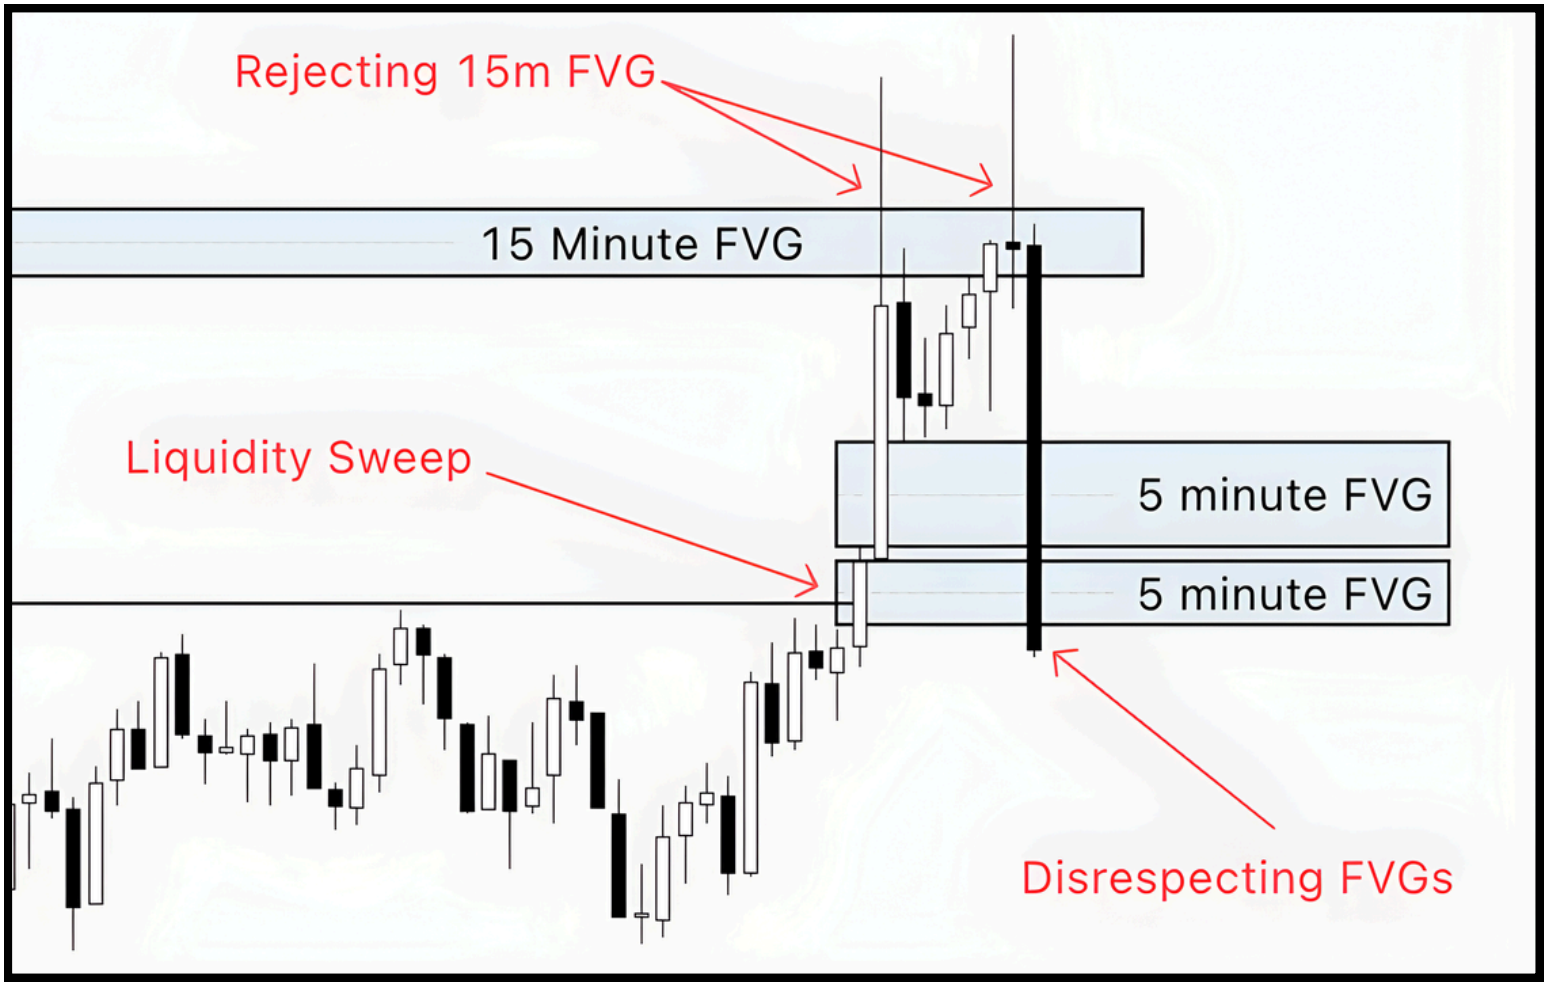

That inversion confirms the shift in order flow. But don't enter yet. You still need Confirmation #4.

**In the below example, there are two FVGs stacked on top of each other. When this happens, both need to be disrespected.*

❌ Common Mistake

Entering at the inversion without waiting for CISD. You'll get stopped out on chop. Wait for structure to break.

CONFIRMATION #3: FVG INVERSION

CONFIRMATION #4: CISD

CISD (Change in State of Delivery) is the final confirmation that structure broke and order flow is reversing.

After the FVG inverts, you need to see price close below the last series of up-close candles leading into the liquidity sweep (it sounds harder than it is!). This proves momentum has shifted and the reversal is confirmed.

✅ **Action items**

- Once the FVG inverts, identify the series of up-close candles leading into the liquidity sweep
- Draw a horizontal line at the first candle's open
- Wait for price to close below that level (for shorts) or above (for longs)

Entry Options

1. Enter immediately on the CISD candle close
2. Wait for a pullback to the CISD level

Stop Loss

- Place stop just above the swept high (shorts) or below the swept low (longs)

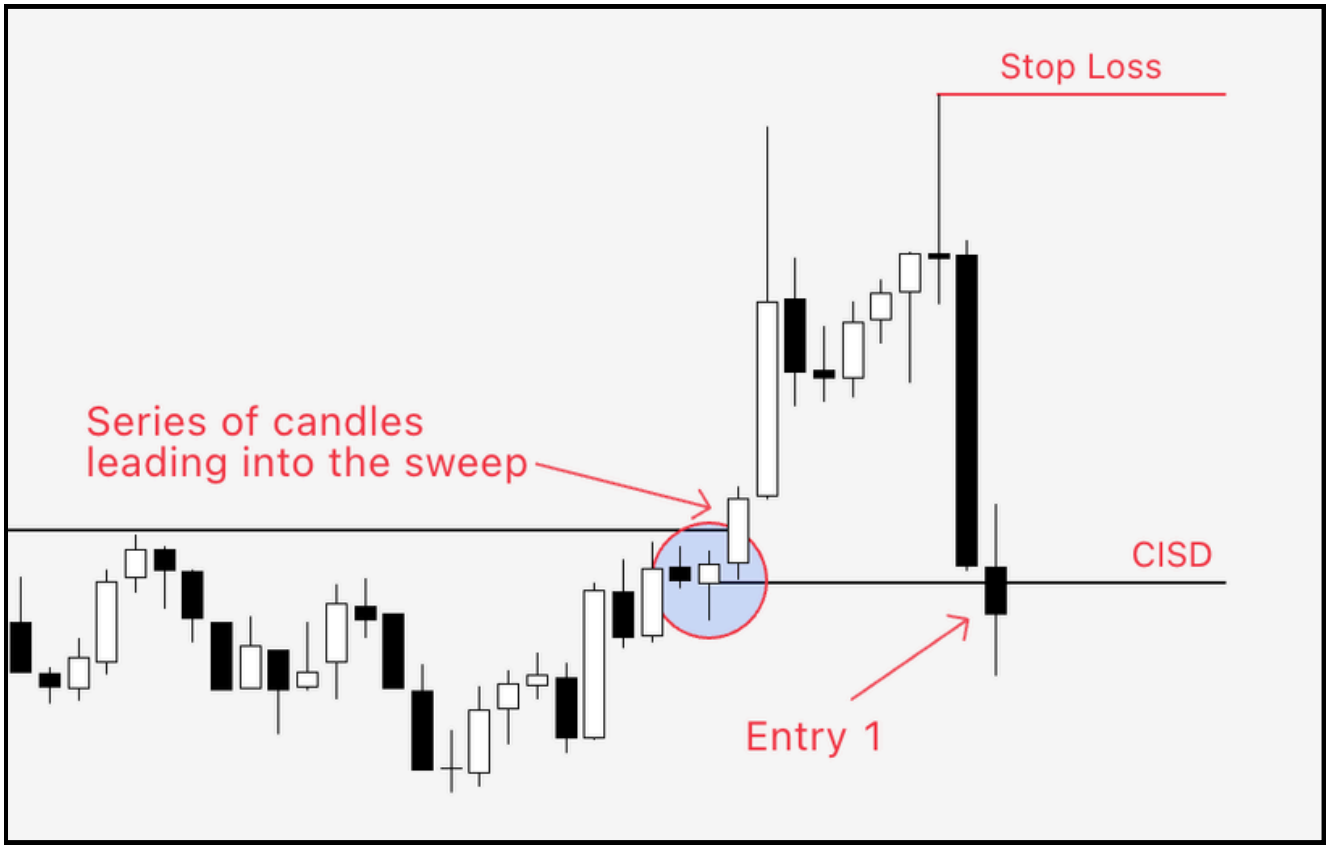

Take Profit

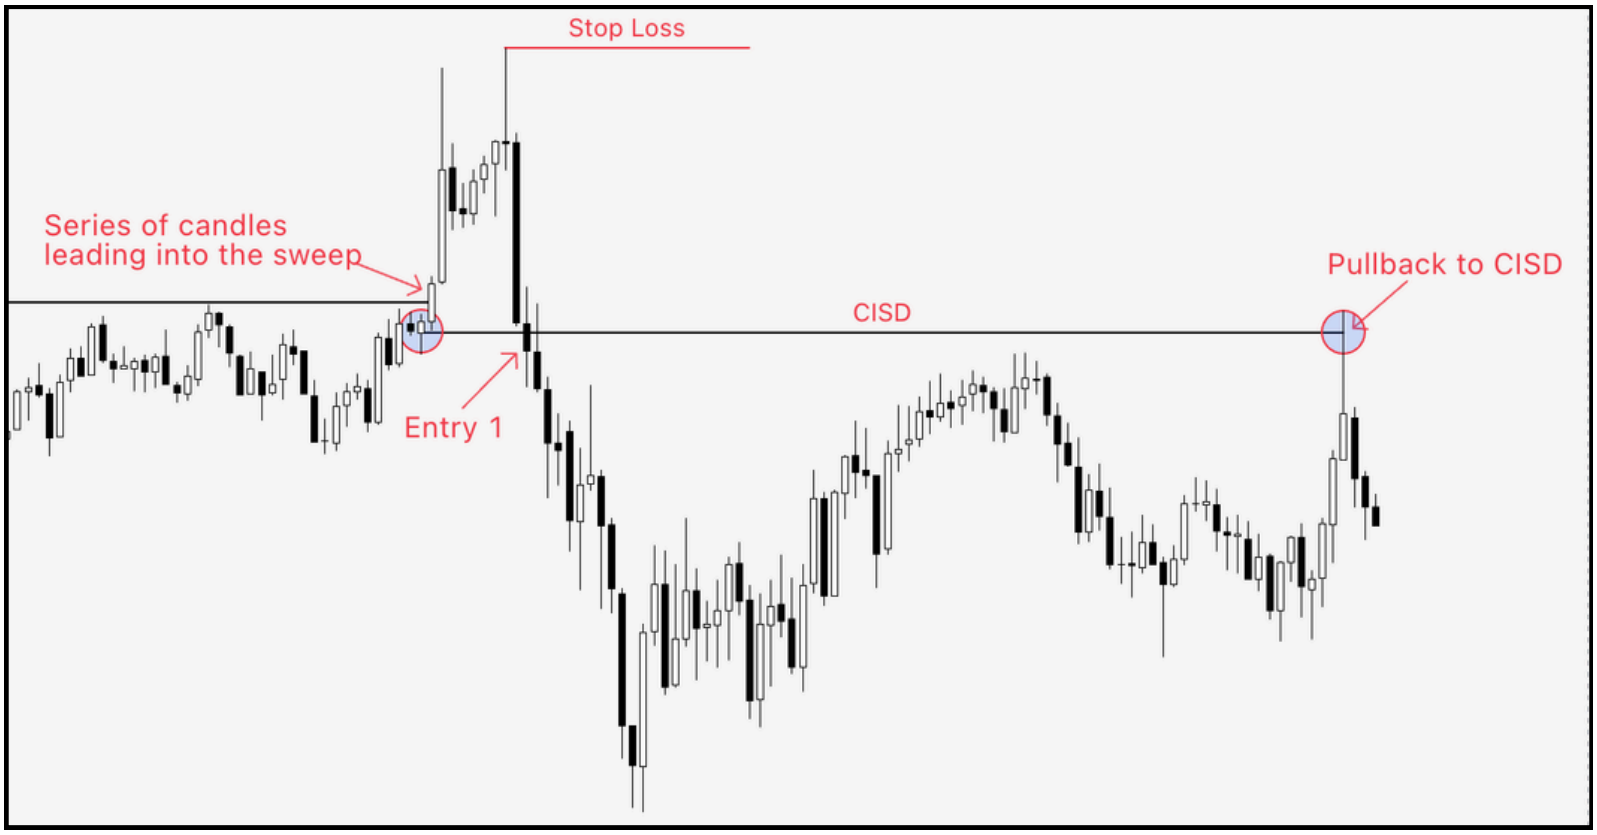

- Target opposing liquidity: the swing high/low on the other side

❌ **Common Mistake**

Entering at iFVG without CISD. Structure hasn't confirmed yet. Wait for price to close through that first candle. That's your proof.

CONFIRMATION #4: CISD

BRINGING IT ALL TOGETHER

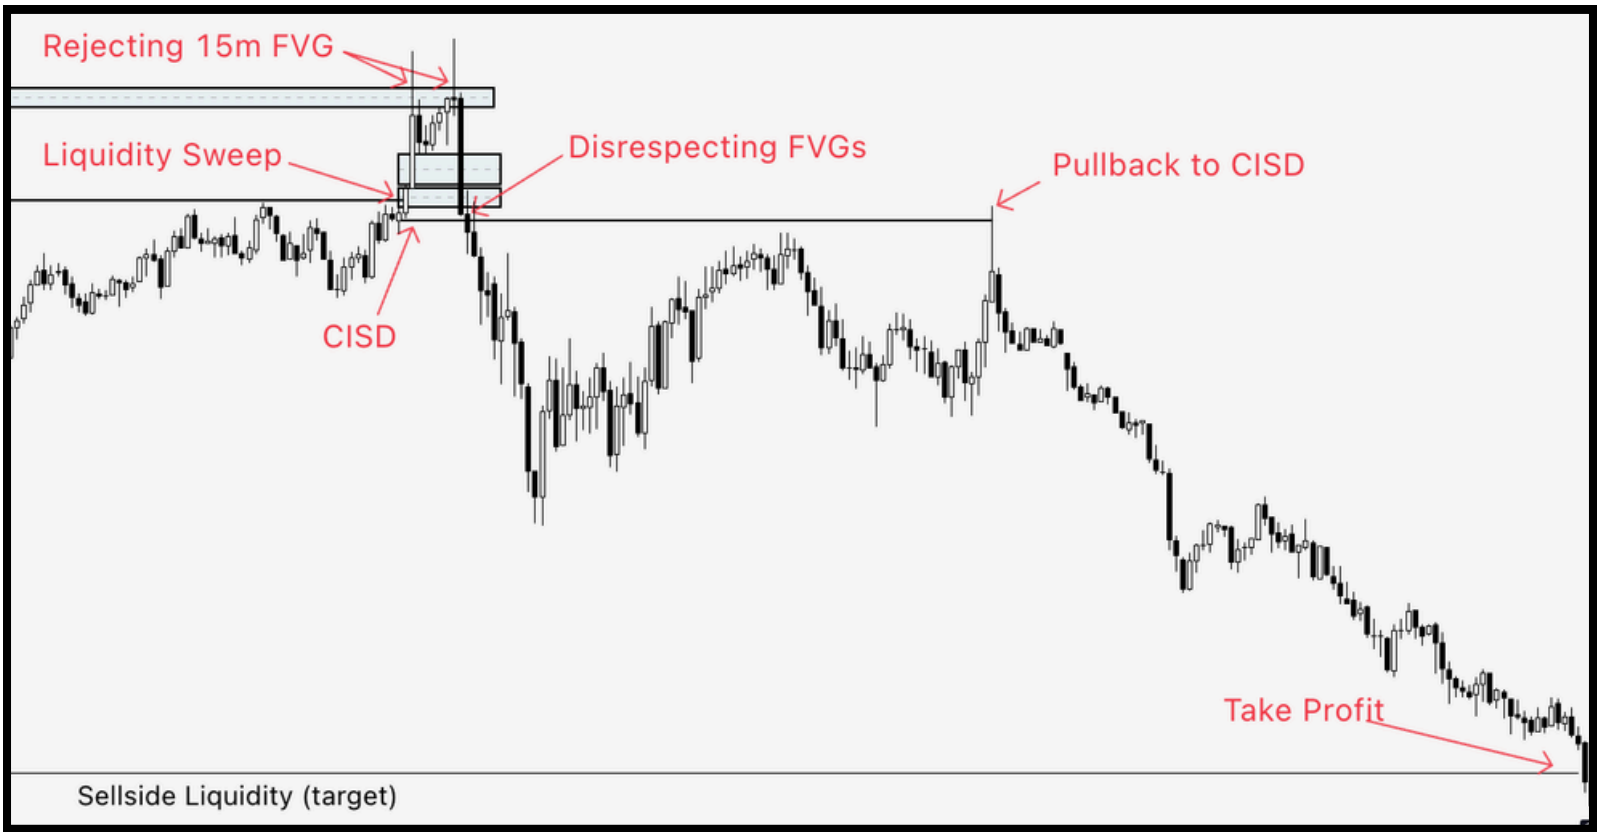

Here's the complete sequence:

1. Liquidity Sweep (external high or low taken)
2. HTF FVG Delivery (1-hour or 15-minute gap respected)
3. FVG Inversion (1-5 minute gap gets disrespected)
4. CISD (structure confirmed broken)

All four must align.

If even one is missing, it's not a trade.

This is the Confirmation Model. It's systematic, repeatable, and designed to keep you out of bad setups while catching high-probability moves.

WHEN NOT TO TRADE

If you don't have all four confirmations, don't trade. Here are the most common red flags:

No liquidity sweep – If price doesn't take out a clear swing high or low, there's no setup.

HTF FVG getting violated – If the 1-hour or 15-minute FVG is being chopped through instead of respected, walk away.

iFVG without CISD – You have three confirmations but no structure break yet? Don't enter. Wait.

Choppy, unclear price action – If you're squinting to make it work, it's not there.

No clear target – If you don't know where you're aiming (opposing liquidity), don't enter.

Missing a trade because you waited for confirmation is infinitely better than taking a bad trade because you were impatient. The market will always provide you opportunity and there will always be another trade.

Patience isn't passive. It's the discipline that separates professionals from gamblers. Choose who you want to be.

DAILY CHECKLIST

Before Market Open:

- Mark swing highs and lows on 1-hour chart
- Identify respected HTF FVGs (1hr/15min)
- Note any major news events
- Review yesterday's trades

During New York Open (9:30–11:00 AM):

1. ✅ Confirmation #1: Wait for liquidity sweep
2. ✅ Confirmation #2: Check HTF FVG delivery
3. ✅ Confirmation #3: Drop to 1-minute, wait for iFVG inversion
4. ✅ Confirmation #4: Wait for CISD
5. ✅ All four aligned? Enter trade

- Set stop above/below swept level
- Set take profit at opposing liquidity

If all four don't align:

- Close charts and walk away
- No trade is better than a bad trade

By 11:00 AM:

- Close all charts (win or lose, you're done)
- Journal the trade or why you didn't take one
- Move on with your day

One or two high-quality trades a week is all you need. This isn't about volume. It's about precision.

NEXT STEPS

You now have the complete Confirmation Model.

Backtest it. Pull up past charts and look for these setups. Mark all four confirmations. See how often they align.

Paper trade it. Use a demo account and practice executing this during the New York open. No real money yet, just reps.

Trust the process. When all four confirmations align, take the trade with confidence. When they don't, walk away with confidence. Both are wins.

Knowing the model is one thing.

Following it every day is another.

Most traders don't miss the confirmations because they can't see them. They miss them because they take the trade anyway, enter early, or talk themselves into a setup that's almost there. That's the blind spot, and it's hard to catch in your own trades.

That's what my mentorship is for. Every week, I look at your actual trades and show you where the process broke down, so you can fix it before it costs you another account.
